

LangChain Sample Document

This PDF is intended for practicing LangChain document loaders.

About Artificial Intelligence

Artificial Intelligence (AI) enables machines to perform tasks that typically require human intelligence. Large Language Models (LLMs) can understand, generate, summarize, and answer questions about text.

About Retrieval-Augmented Generation (RAG)

In a RAG pipeline, documents are loaded, split into smaller chunks, converted into embeddings, stored in a vector database, retrieved based on a user's query, and finally passed to an LLM to generate accurate answers grounded in the source documents.

Sample Facts

1. LangChain provides document loaders for PDFs, text files, CSVs, websites, and more.
2. PyPDFLoader is commonly used to load PDF documents.
3. TextSplitter divides large documents into manageable chunks.
4. Embeddings convert text into numerical vectors for semantic search.
